METHOD, SYSTEM, AND PROGRAM FOR TRANSMITTING FACSIMILES IN A NETWORK ENVIRONMENT

ABSTRACT

Disclosed is a system, method, and program for processing a message in a

5   network computing system including a facsimile transmission comprised of a recipient contact address, such as a telephone number, e-mail address, network address, etc., and message content. The message content includes at least one of message text and attached files. A first computing system manages the facsimile transmission as a fax job and transfers the message content to a second computing

10   system. The second computing system launches at least one application program to convert the message content to at least one image in a file format and transfers the converted message content in the file format to the first computing system. The first computing system transfers the message content in the file format to a communication port for transmittal to the recipient contact address.
